

VESDA Customer Success Story

Warehouse for Document Storage

“I’ve always been impressed with VESDA and the ability to adjust the sensitivity of the detectors to the environment and varying conditions of the protected area, which you can’t do with standard spot detectors. This feature is especially important when it comes to protecting historical and high-value assets.”

— Keith Frangiamore, Certified Fire Protection Specialist
Vice President of Operations
Fire Safety Consultants, Inc.

A 300,000-square-foot warehouse in Elgin, Illinois, used for long-term storage of government documents is being protected by VESDA by Xtralis. Integrated with a pre-action sprinkler system, VESDA air-sampling smoke detectors provide the earliest possible warning of a fire so appropriate actions can be taken to prevent damage or loss.

“Sprinkler systems are designed to save lives, contents and buildings from fire, but the contents of those facilities are subject to water damage from a false sprinkler activation,” explains Keith Frangiamore, vice president of operations for Fire Safety Consultants, Inc. “Water damage in a setting like this where there are thousands of boxes of stored documents would be astronomical. Therefore, you have to consider protecting what you need to protect and balance that with the cost of a false activation.”

Warehouse
300,000-square-foot facility
subdivided into three
100,000-square-foot storage
areas

Location: Elgin, Illinois
Industry: Document Storage

Consulting Firm:
Fire Safety Consultants, Inc.

Solutions:
VESDA VLS Air-sampling
Smoke Detectors

Benefits:

- High sensitivity that can be set according to environmental conditions
- Flexible sampling pipe design
- Lower total cost of ownership
- Easy maintenance

VESDA Customer Success Story

The warehouse in Elgin is subdivided into three distinct chambers, each with ceilings that are 34 feet high and containing approximately 100,000 square feet for multi-row rack storage with three levels – a grated floor and two catwalks. Each chamber is protected by 64 VESDA VLS detectors along 8 sampling lines connected to a Proactiv panel.

In this case, and in others where there are high ceilings, the VESDA sampling pipe network can be designed to ensure optimum coverage even if smoke stratification occurs. The pipes also can be placed near air-handling or heating/air conditioning units to ensure smoke particles in those areas are detected early. In addition, the sampling pipe network must be designed to monitor air flow in voids under the floor, according to Frangiamore.

“Hundreds of spot detectors would have been required to protect this space and all the trapped areas,” he explained. “However, we only had to use 64 VESDAs in each chamber, so the total cost of ownership is much lower, and false alarms and subsequently false sprinkler activations can be avoided because of the detectors’ high sensitivity.”

Of course, VESDA systems need to be tested after installation and periodically thereafter, notes Frangiamore. However, ongoing maintenance is “very easy” because the control panel issues a warning when the filters need to be replaced.

“We continue to see more and more VESDA systems deployed in various environments – from the cleanest to the dirtiest,” Frangiamore says. “They offer superior protection for high-value assets and zero-tolerance environments because of their sensitivity and design flexibility.”

Fire Safety Consultants, Inc. (FSCI) specializes in fire protection consulting for municipal building departments and fire departments throughout the United States.

They are one of the largest private fire protection plan review service companies in the country, performing fire protection plan reviews for more than 185 municipalities and fire departments as well as many private companies throughout the U.S. and the rest of the world.

FSCI’s principals and senior consultants are involved in the code development process on the state and national level. Some of these committees include NFPA 13, NFPA 24, NFPA 72, NFPA 101, NFPA 291, NFPA 1201, NFPA 1250, NFPA 5000, and The International Building Code and International Fire Code.
